Structures

Bundling information

Sometimes a number of variables belong logically together. For instance two doubles can be the x, y components of a vector.

This can be captured in the struct construct.

```
struct vector { double x; double y; int label; } ;
```

(This can go in the main program or before it.)

The elements of a structure are usually called *members*.

How to use structures

- 1. Declare what is in your structure;
- 2. Make some structures;
- 3. Use them.

```
// definition of the struct
struct AStructName { int num; double val; }
int main() {
   // declaration of struct variables
   AStructName mystruct1,mystruct2;
   .... code that uses your structures ....
}
```

Using structures

Once you have defined a structure, you can make variables of that type. Setting and initializing them takes a new syntax:

Code:

Output [struct] point:

Review quiz 1

True or false?

- All members of a struct have to have the same type.
- Writing struct numbered { int n; double x; }; creates an object with an integer and a double as members.
- With the above definition and struct numbered xn;, cout << xn << endl; is correct C++.
- Same, xn.x = xn.n+1;

Struct initialization

You assign a whole struct, or set defaults in the definition.

```
struct vector_a { double x; double y; };
// needs compiler option: -std=c++11
struct vector_b { double x=0; double y=0; };
int main() {
  // initialization when you create the variable:
  struct vector_a x_a = \{1.5, 2.6\};
  // initialization done in the structure definition:
  struct vector b x b:
  // ILLEGAL:
  // x_b = {3.7, 4.8};
  x_b.x = 3.7; x_b.y = 4.8;
```

Functions on structures

You can pass a structure to a function:

Code:

Output [struct] pointfun:

```
double distance
                                   Displacement x, y?
  ( struct vector v1,
                                   dx=5, dy=12
    struct vector v2 )
                                   Distance: 13
  double
    d1 = v1.x-v2.x, d2 = v1.y-v2.y;
  return sqrt( d1*d1 + d2*d2 );
  /* ... */
  struct vector v1 = \{ 1., 1. \};
  cout << "Displacement x,y?";</pre>
  double dx,dy; cin >> dx >> dy; cout << endl;
  cout << "dx=" << dx << ", dy=" << dy << endl;
  struct vector v2 = { v1.x+dx,v1.y+dy };
  cout << "Distance: " << distance(v1,v2) << endl;</pre>
```

Write a function that, given a vector as defined above, returns the angle with the x-axis. (Hint: the atan function is in cmath)

Code:

```
struct vector a = {1.,1.};
double
   alpha = angle(a),
    pifrac = (4.*atan(1.0)) / alpha;
cout << "Angle of ("
   << a.x << "," << a.y
   << ") is " << angle(a)
   << ", or pi/" << pifrac
   << endle:</pre>
```

Output [struct] pointangle:

```
Angle of (1,1) is 0.785398, or pi/4
Angle of (0.866025,0.5) is 0.523599, or pi/6
```

Write a void function that has a struct vector parameter, and exchanges its coordinates:

$$\begin{pmatrix} 2.5 \\ 3.5 \end{pmatrix} \rightarrow \begin{pmatrix} 3.5 \\ 2.5 \end{pmatrix}$$

Returning structures

You can return a structure from a function:

Code:

Output [struct] pointadd:

Write a function y = f(x, a) that takes a struct vector and double parameter as input, and returns a vector that is the input multiplied by the scalar.

$$\begin{pmatrix} 2.5 \\ 3.5 \end{pmatrix}, 3 \rightarrow \begin{pmatrix} 7.5 \\ 10.5 \end{pmatrix}$$

Denotations

You can use initializer lists as struct denotations:

Code:

Output [struct] pointdenote:

```
cout << "Distance: "
      << distance( {1.,2.}, {6.,14.} )
      << endl;</pre>
```

Write a function inner_product that takes two vector structures and computes the inner product.

Write a 2×2 matrix class (that is, a structure storing 4 real numbers), and write a function multiply that multiplies a matrix times a vector.

Can you make a matrix structure that is based on the vector structure, for instance using vectors to store the matrix rows, and then using the inner product method to multiply matrices?

Project Exercise 6

Rewrite the exercise that found a predetermined number of primes, putting the number_of_primes_found and last_number_tested variables in a structure. Your main program should now look like:

```
cin >> nprimes;
struct primesequence sequence;
while (sequence.number_of_primes_found<nprimes) {
  int number = nextprime(sequence);
  cout << "Number " << number << " is prime" << endl;
}</pre>
```

Hint: the variable last_number_tested does not appear in the main program. Where does it get updated? Also, there is no update of number_of_primes_found in the main program. Where do you think it would happen?

Turn it in!

- If you have compiled your program, do: sdsteststruct yourprogram.cc
 where 'yourprogram.cc' stands for the name of your source file.
- Is it reporting that your program is correct? If so, do: sdsteststruct -s yourprogram.cc
 where the -s flag stands for 'submit'.
- If you don't manage to get your code working correctly, you can submit as incomplete with sdsteststruct -i yourprogram.cc
